Regularity hypothesis

Classical formulation for solving our problems :

data f

solution x

Example : minimization of the total variation

Regularity hypothesis

Classical formulation for solving our problems :

data f

solution x

Example : minimization of the total variation

The solution x may be a labeling :

Regularity hypothesis

Classical formulation for solving our problems :

data f

$$\rightarrow \boxed{\min_{x} \int_{\Omega} \underbrace{||\nabla x(z)|| \quad \mathrm{d}z}_{\text{Regularization}} + \underbrace{\mathcal{D}(x, f)}_{\text{Data fidelity}}} \rightarrow$$

Example : minimization of the total variation

The solution x may be a labeling :

• partitionning an image in different regions

Regularity hypothesis

Classical formulation for solving our problems :

 $\rightarrow \left| \min_{x} \int_{\Omega} \underbrace{||\nabla x(z)|| \quad dz}_{\text{Regularization}} + \underbrace{\mathcal{D}(x, f)}_{\text{Data fidelity}} \right| -$

solution x

data *f*

Example : minimization of the total variation

The solution x may be a labeling :

- partitionning an image in different regions
- estimating a depth map for stereo-vision reconstruction

Regularity hypothesis

Classical formulation for solving our problems :

data f

$$\rightarrow \boxed{\min_{x} \int_{\Omega} \underbrace{||\nabla x(z)|| \quad dz}_{\text{Regularization}} + \underbrace{||x - f||_{2}^{2}}_{\text{Data fidelity}}} \rightarrow$$

solution *x*

Example : minimization of the total variation

The solution x may be a labeling :

- partitionning an image in different regions
- estimating a depth map for stereo-vision reconstruction
- restored intensities of an image f [ROF model, 1992]

2) Flow constrained image restoration

Minimal surfaces

Ē.

1) Flow constrained image segmentation

Motivation

- In the continuum : Minimal cut (surface in 3D) is dual of continuous maximum flow [Strang 1983]
- In the classic discrete case min-cut (= "Graph cuts")/ max flow duality but grid bias in the solution
- Recent trend : employ a spatially continuous maximum flow to produce solutions with no grid bias

Max Flow (Graph Cuts)

Continuous Max Flow [Appleton-Talbot 2006]

Flow constrained image segmentation
 Flow constrained image restoration

Motivation

• [Appleton-Talbot 2006, generalized by Unger-Pock-Bishof 2008] Fastest known continuous max-flow algorithm has **no stopping criteria** and **no converge proof**.

Our contribution : Combinatorial Continuous Maximum Flow

- a new discrete isotropic formulation
- avoids blockiness artifacts
- is proved to converge, is fast
- generalizes to arbitrary graphs

[In SIAM Journal on Imaging Sciences, 2011]

Flow constrained image segmentation
 Flow constrained image restoration

Combinatorial Continuous Maximum Flow (CCMF)

• Incidence matrix of a graph noted A

Continuous MaxFlow	Combinatorial formulation	
$\max_{\vec{F}} \vec{F}_{st}$	max F _{st}	max F
s.t. $\nabla \cdot \overrightarrow{F} = 0,$ $ \overrightarrow{F} \le g.$	s.t. $A^T F = 0,$ $ A^T F^2 \le g^2$	5.0.

Conclusion on the flow-based methods

- Discrete isotropic formulation of the max flow problem that avoids blockiness artifacts
- Guaranteed convergence of the Interior Point method
- Works on arbitrary graphs
- Extension to multi-label problems in a new framework : "dual constrained total variation"

- 4) Surface reconstruction

Non-convex diffusion using power watersheds

• Anisotropic diffusion [Perona-Malik 1990]

Image 100 iterations 200 iterations

Goals of this work :

- \bullet perform anisotropic diffusion using an ℓ_0 norm to avoid the blurring effect
- optimize a non convex energy using Power Watershed [Couprie-Grady-Najman-Talbot, ICIP 2010]

- 1) Image segmentation
- 2) Nonconvex Image filtering
- 3) Stereo-vision
- 4) Surface reconstruction

Anisotropic diffusion and ℓ_0 norm

Leads to piecewise constant results Original image PW result

Image: A marked black

- 2) Nonconvex Image filtering
- 3) Stereo-vision
- 4) Surface reconstruction

How to solve this problem

- Graph : 3D grid
- Here x represents the object indicator to recover.

$$\bar{x} = \lim_{p \to \infty} \arg \min_{x} \sum_{e_{ij} \in E} w_{ij}{}^{p} |x_i - x_j|^{q}$$

s.t. $x(F) = 1$, $x(B) = 0$

• weights : distance function from the set of dots to fit

Why PW are a good fit for this problem?

numerous plateaus around the dots to fit \rightarrow smooth isosurface is obtained

Power watershed solution

Next Challenge : Scene Parsing using New Global Energy Models

- Scene understanding of objects in video
- Need for efficient algorithm to process large amount of data
- Hierarchical CRF [Ladický-Russell-Kohli-Torr 2009] have shown good results.
- Study the possibility of applying this optimization approach for solving the problem using watersheds
- Advantages : speed, global optimality

Chapter 3 : Dual constrained TV based formulation

•
$$C = \bigcap_{i=1}^{m-1} C_i$$
, $C_i = \{F \in \mathbb{R}^M \mid \|\theta_i \cdot F\|_{\alpha} \le g_i\}, \alpha \ge 1$.

Example adapted to image denoising

- $g_i \in \mathbb{R}^N$ weight on vertex *i*, inverselly function of the gradient of *f* at node *i*.
- Flat area : weak gradient \rightarrow strong $g_i \rightarrow$ strong $F_{i,j}$ \rightarrow weak local variations of x.
- Contours : strong gradient \rightarrow weak $g_i \rightarrow$ weak $F_{i,j}$ \rightarrow large local variations of x allowed.

Dual problem

• Fenchel-Rockafellar dual problem :

$$\min_{F\in\mathbb{R}^{M}} \sum_{i=1}^{s} f_{i}(F) + f_{s+1}(F)$$
